(54) Title: ITEM IDENTIFICATION USING ELECTRONIC TAGS

(57) **Abstract:** The present invention relates to a method and a system for identifying an item (1) to which a radio frequency tag is attached by means of a radio frequency tag detector (101), wherein radio frequency contact is established between the tag and the detector (101) and information associated with the item (1) and being stored by the tag is received by the detector (101). The invention is based on the idea that the data stored by the tag is mapped against a unique item identifier. This unique item identifier is then presented for a user of the detector (101). By employing the present invention, it is possible to identify an item (1) by attaching a small tag to it. This is particularly advantageous in the case where the item (1) to which the tag is attached is very small, such that it is practically difficult to write information on the item (1) itself or on the item casing.
